SUMMARY OF REVISED
HEC-2 MODELS
10-26-00

Four separate HEC-2 models are included with this submission. This brief summary will describe the purpose of each of the models, as well as all changes and revisions to the FEMA HEC-2 models of 10-26-00 to create the models presented.

Lexington Multiple Model

This model was created to predict base flood elevations for Lexington County. Base flood elevations for Lexington County are computed with the levee in place, as this is the worst-case scenario. This model is included with this submission as **LXMUL.DAT**. This model has been modified from the Lexington multiple model presented by FEMA on 10-26-00 in the following manner:

- Base for model is HEC-2 model presented by FEMA, **CONLX2KR.DAT**.

- At section 246700, the channel "n" value was changed from 0.040 to 0.038. This change was done for the **LXMUL.DAT** HEC-2 model submitted to FEMA on 10-12-00, however, it was changed back to 0.040 because this cross-section was used as a calibration section. We have performed a sensitivity analysis on this change (documented in the included model **LXSEN.DAT**). The results of this sensitivity analysis show that the maximum change in WSEL (due to the "n" value change from 0.040 to 0.038) is –0.04 foot at section 246700. Upstream of the change are several 0.01 foot increases. Since the change in modeling results is insignificant when changing the channel "n" value from 0.040 to 0.038, the channel "n" value was set at 0.038 for consistency between adjoining upstream and downstream cross-sections.

- At section 247000, the FEMA Lexington multiple model predicts that 134,970 CFS will flow landward of the levee. This is representative of 45.2% of the total flow in the Congaree River during the passage of the 100-year storm event. This flowrate landward of the levee occurs even though the entire flow area landward of the levee has been designated as "ineffective" by the use of "n" = 10. To correct the situation, the data set on GR records for section 247000 was truncated from the top of the levee through the remainder of Richland County. This is technically appropriate, since the concept of the Lexington multiple model is that no flow occurs landward of the levee on the Richland County side.

- At section 250770, the data set landward of the levee through Richland County was truncated as was done at section 247000. At section 250770, the FEMA Lexington multiple HEC-2 model predicts that 125,926 CFS (or 42.2% of the total 100-year flow) will be conveyed landward of the levee. Truncation of the GR point from the levee top landward into Richland County alleviates the problem.

The revised Lexington multiple HEC-2 model (**LXMUL.DAT**) resulting from the above changes yields a much more stable model than the Lexington multiple model presented by FEMA on 10-18-00 (**CONLX2KR.DAT**). The HEC-2 model as presented by FEMA indicates as much as a 2.04 foot drawdown between sections 250770 and 253400. This drawdown significantly affects the computation of Base Flood Elevations for the remainder of the model upstream of section 250770. By truncating the GR records at

247000 and 250770 in the manner indicated, the instability in the HEC-2 model is removed. This truncation of GR points is technically appropriate, since the Lexington model is for the levee in-place scenario, and no effective conveyance is to exist landward of the levee.

Lexington Floodway Model

This model was created to model floodway for Lexington County with the levee in place. This model is included with this submission as **LXFW.DAT**. The base model for creation of the Lexington floodway model is the revised Lexington multiple model, as described above. During floodway computations, the floodway boundary is set at the top of levee location (Richland County side) and the same encroachments are used for the Lexington County side as are used in the FEMA floodway model for the Congaree River, **CONFW2KR.DAT**. All encroachments upstream and downstream of the levee location, for both Richland and Lexington counties, are set at the locations presented in the FEMA floodway model. Some encroachment exceptions exist at sections 246700, 247000, 247200, 248200, 249300, and 249590. At these sections, the floodway boundary is pushed outside the limits of floodway as indicated in the FEMA floodway model **CONFW2KR.DAT**. However, the floodway limits remain at, or on the river side of, the floodway line as presented on the preliminary FIRM for Lexington County on 9-26-00. Therefore, the slight change in floodway boundary from this revised Lexington floodway model and the FEMA's floodway model of 10-18-00 will not change the floodway as mapped by FEMA on the preliminary FIRM for Lexington County (released for comment 9-26-00).

Lexington CLOMR-Ready Floodway Model

This model is based on the revised Lexington floodway model (**LXFW.DAT**), and is included with this submission as **LXFWCLMR.DAT**. This model has been revised to reflect the top of levee elevations that will be required to provide three (3) feet of freeboard in the 500-year storm event, as predicted by the revised Lexington multiple model (**LXMUL.DAT**). This model is CLOMR and No-Rise ready, as it shows no change in floodway delineation from the revised Lexington floodway model, and no change in Base Flood Elevation as compared to the revised Lexington multiple and floodway models.

Lexington Sensitivity Model

This model is based on the Lexington multiple model provided by FEMA on 10-18-00 (**CONLX2KR.DAT**) and is included with this submission as **LXSEN.DAT**. This model quantifies the differences in WSEL that occur when the channel "n" value at section 246700 is changed from 0.040 to 0.038. The results of this model show that the maximum change in WSEL (100-year storm event) is –0.04 foot at section 246700, with several increases of 0.01 foot from section 247000 to section 269300. There is no increase more than 0.01 foot as a result of this modification.

Model Left Overbank flowrates and WSEL tabulation

Base model for this comparison is the revised Lexington multiple HEC-2 model, based on the revised Lexington multiple HEC-2 model presented by FEMA on 10-18-00. The changes made to the FEMA Lexington model provide a much more stable HEC-2 model with the levee in place. Note the removal of the instabilities in WSEL when comparing the FEMA Lexington multiple model with the revised Lexington multiple model.

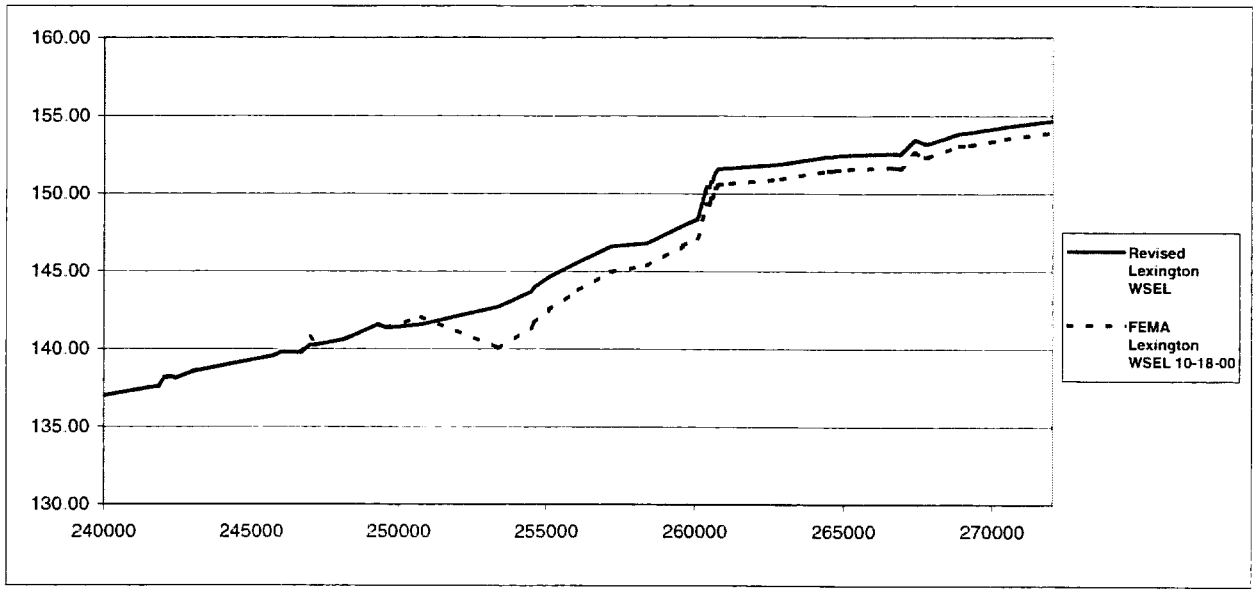
Revised Lexington Model



Model Left Overbank flowrates and WSEL tabulation

Base model for this comparison is the Richland multiple HEC-2 model, presented by FEMA in Atlanta on 10-18-00. This HEC-2 model assumes the levee has breached, and conveyance will occur landward of the levee.

River Station	Computed WSEL (ft)	Computed EGL (ft)	Slope EGL X 10,000	.01 X Conveyance	Total Flowrate (CFS)	Left Overbank Flowrate (CFS)	Channel Flowrate (CFS)	Right Overbank Flowrate (CFS)	% total flow in LOB

Water Surface Elevation

Model Left Overbank flowrates and WSEL tabulation

Base model for this comparison is the Lexington multiple HEC-2 model, presented by FEMA in Atlanta on 10-18-00. This HEC-2 model assumes the levee has not breached, and conveyance will not occur landward of the levee.

River Station	Computed WSEL (ft)	Computed EGL (ft)	Slope EGL X 10,000	.01 X Conveyance	Total Flowrate (CFS)	Left Overbank Flowrate (CFS)	Channel Flowrate (CFS)	Right Overbank Flowrate (CFS)	% total flow in LOB

Note: *Bold numbers under levee top elevation are elevations taken from HEC-2 model (aerial topo information). All others are field verified top elevations.*

Lexington HEC-2 model BFE sensitivity

The purpose of this comparison is to model the sensitivity of the Lexington multiple model to changes in the channel "n" value at section 246700. The FEMA multiple model of 10-18-00 sets the "n" value at 0.040. The revised Lexington multiple model sets the "n" value at 0.038.

Levee Top Elevation Adjustment

This is a brief calculation of the overall fill required to bring the levee top elevation to the required height to maintain FEMA freeboard requirements.

Freeboard Requirement (per FEMA 37) ==>

1) A minimum freeboard requirement of three (3) feet is necessary along the entire levee.

2) An additional one (1) foot of freeboard is required within 100' of strucutures within the levee or wherever flow is restricted, such as bridges (in this case, I-77).

3) An additional one-half (0 5) foot of freeboard is required at the upstream end of the levee.

Richland County Requirements ==>

1) Top of levee elevation must be equal or greater than the 500-year elevation plus three (3) feet.

River Station	100 yr. HEC-2 WSEL	500 yr.
